

**MEXICO:** From September 20 to 22, Tropical Storm Norman flirted with the western coast of Colima, Jalisco, and Sinaloa, with sustained winds less than 40 knots (46 mph). Norman helped to produce widespread showers (50-100 or more) along the western Mexican coast and caused local flooding. Scattered showers (10-48 mm) maintained moisture supplies in the main corn belt. Dry weather prevailed across northeastern and northern Mexico. Temperatures averaged 1 to 3 degrees C above normal across most of Mexico.
